

Information Collection

DATA and COMPOSITE

Find, identify and meaningfully propagate uncertainties from data sources

QUALITATIVE

Multiple opinions to obtain a discrete set of valid options

If data is uncertain, it is presented as a distribution

$$\mathbb{D} = \{f_{c1}(x), \dots, f_{cn}(x)\}$$

Set of input data distributions, one per each indicator

Elicitation sessions

PILE-BWT

Pairwise comparisons, solved by optimization

All the weight sets from the weight space are valid

$$\mathbb{W} = \{\underline{w}_a, \underline{w}_b\}$$

Set of allowable weight spaces, one per each opinion

Mid-point splitting method and direct elicited corrections

Every value function is valid and might be considered

$$\mathbb{V} = \{\underline{v}_a, \underline{v}_b\}$$

Set of allowable value functions one per each opinion
